

Do They Make Interference Engines

Interference engine. By contrast, in a non-interference engine the piston does not travel into any area into which the valves open. Interference engines rely on timing gears, chains, or belts to prevent the piston from striking the valves by ensuring that the valves are closed when the piston is near top dead center.

Best Answer: Interference engines have smaller, more compact combustion chambers that are more efficient producing fewer emissions, better performance and fuel efficiency. They are more common on higher performance engines because of this but also are used to make some normal engines more fuel efficient and burn cleaner.

Here's What Interference Engines Are And Why They Exist At All

a naive question, but why, if a failed \$23 serpentine belt will fry a \$3000+ interference engine, would anyone build an interference engine? Is an interference engine so much more efficient, cheap, easier to repair or what?

Best Answer: The reason is very simple, to get the most horse power for pound! This is a result of building a high compression head, and while many drivers want the added horsepower, very few are happy with the repair bills that such engines can create. So the choice is simple, get a lower performance car ...

Why do car manufacturers still make interference engines ...

In an interference engine, if a timing belt breaks while driving, there is a good chance that the engine might be severely damaged. A non-interference engine will stall, if a timing belt breaks, but further damage might be limited.

Interference And Non-Interference Timing Belt Or Chain

On a non interference engine, if the piston is at top dead center AND the valves are pushed all the way down, they still can not touch, so a timing belt mishap doesn't do as much damage. I've always heard that if you have an interference engine, you should change the timing belt at 100,000 miles.
